PROJECT TITLE: Promoting Conservation Biocontrol of Beneficial Insects
Project Manager: Vera Krischik  
Affiliation: University of Minnesota  
Mailing Address: 1980 Folwell Ave # 219  
City / State / Zip: St. Paul, MN 55108  
Telephone Number: 612-625-7044  
Email Address: krisc001@umn.edu  
Web Site Address: www.entomology.umn.edu/cues

Location: Statewide

Total ENRTF Project Budget: ENRTF Appropriation: $400,000  
Amount Spent: $0  
Balance: $400,000

Legal Citation: M.L. 2017, Chp. 96, Sec. 2, Subd. 08b

Appropriation Language: $400,000 the first year is from the trust fund to the Board of Regents of the University of Minnesota to research integrated pest management strategies, including insecticide alternatives, and overwintering habitat sites to conserve beneficial insects, including bees, butterflies, and predator insects. The integrated pest management strategies will be used to develop best management practices to increase pollinator and beneficial insect diversity and abundance in various restored habitats. This appropriation is available until June 30, 2020, by which time the project must be completed and final products delivered.
I. PROJECT TITLE: Promoting conservation biocontrol of beneficial insects

II. PROJECT STATEMENT:
The project’s goals are to research ways to conserve beneficial insects (bees, butterflies, predators, and parasitoids) in landscapes and restoration projects thru conservation biocontrol, cultural management, use of EPA registered biorational insecticides, and proper conventional insecticide use.

Numerous local and state programs are involved with habitat restoration, which require bee-friendly plants to conserve beneficial insects. Beneficial insects include bees, butterflies, predators, and parasitoids. More than 99.9% of all insects are beneficial and these insects rely on pollen and nectar from plants to complete their life cycle. These restorations must be managed thru the principles of Integrated Pest Management (IPM). IPM promotes multiple tactics to manage, including biocontrol, conservation biocontrol, and using biorational insecticides friendly to beneficial insects, and proper use of conventional insecticides. Conservation biocontrol is the use of sustainable, cultural tactics, such as overwintering sites, conservation of ground nesting sites, mulch piles, and appropriate mowing practices. IPM promotes proper use of conventional insecticides including application practices, such as avoiding drift, spraying when bees are not active, using thresholds of pest abundance, and monitoring to see if the application was successful. Research and educational outreach are needed to demonstrate that these tactics increase beneficial insect abundance. We will promote the research results thru peer-reviewed publications, websites, webinars, bulletins, workshops, and talks.

This outreach program and applied research is different from our 2014 LCCMR grant as we are investigating ways to manage restorations so that they are supportive of beneficial insects. We will produce outreach products (website, bulletins, webinars, workshop) and work with university and community groups to disseminate the research results and outreach programs. For products from previous work visit the pollinator conservation website (http://cues.cfans.umn.edu/old/); UMinnesotan Extension website http://www.extension.umn.edu/garden/plant-nursery-health/; NCIPM webinars website+pollinator+plant videos http://ncipmhort.cfans.umn.edu/; and a list of pollinator publications at http://www.entomology.umn.edu/faculty-staff/vera-krischik; MN Arboretum Pollinator Cubed Workshops http://www.arboretum.umn.edu/P3Pesticides2.aspx

III. OVERALL PROJECT STATUS UPDATES:
Project status as of February 15 2018
Project status as of August 15 2018
Project status as of February 15 2019
Project status as of August 15 2019
Project status as of February 15 2020
Project status as of August 15 2020
Final report summary: August 30 2020

Overall Project Outcomes and Results:
The project’s goals are to research ways to conserve beneficial insects (bees, butterflies, predators, and parasitoids) in landscapes and restoration projects thru conservation biocontrol, cultural management, and proper conventional and biorational insecticides, using the principles of integrated pest management (IPM).

IV. PROJECT ACTIVITIES AND OUTCOMES:

Activity 1: Conservation biocontrol in restorations. We will develop research and outreach educational programs on conservation biocontrol of beneficial insects by promoting cultural management, such as overwintering sites, native bee nesting sites, mowing times, and proper plant choice in small restorations. We plan to research the benefits of 4 types of cultural management:
1. Mulch piles or overwintering banks to conserve predatory insects and bees during the winter.

2. Duration of standing plant stems in spring so native bees can leave the stems as adults and not die if the stems are removed early.

3. Best seasonal times to mow to encourage new flowering.

4. Identify the best larval host plants in MN for butterflies and bees and the best pollen and nectar producing plants for adult beneficial insect feeding in restorations.

We plan to investigate the current levels of pesticide residue in plants in 4 areas that are considered good habitat for restoration.

1. Milkweed plants growing in roadsides and in restorations near high pesticide use areas may contain residues that affect monarch adults and larvae. Pesticide may be present from road deicers, mosquito abatement programs, and runoff (Repeated application of deicing salts test at 960 ppb imidacloprid has the potential to create residues that harm pollinators, since 40 ppb is the LD50 for bees, Niagara bee, August 2016; Krischik V, M Rogers, G Gupta, A Varshney. 2015. Soil-applied imidacloprid is translocated to ornamental flowers and reduces survival of adult Coleomegilla maculata, Harmonia axyridis, and Hippodamia convergens lady beetles, and larval Danaus plexippus and Vanessa cardui, PLoS ONE March 23, 2015, DOI: 10.1371/journal.pone.0119133).

2. Orchard mason bee (Osmia lignaria) makes 25 pollen trips to support one egg. In addition, leaf cutter bees (Megachile rotundata) use pollen and rose petals to line their nests. We want to determine if the use of current insecticides impact the larvae of leaf cutter bees when their nests are provisioned with leaves and pollen balls. We will promote the proper use of EPA registered insecticides that are compatible with bees.

3. Basswood trees no longer create a good honey flow, according to MN bee keepers. We will investigate whether basswood trees near ditches contain pesticide residues in flowers.

4. Ground covers in agricultural fields are important for conserving soil and moisture, as well as providing pollen and nectar to beneficial insects. We will investigate whether these ground covers accumulate pesticides in sufficient amounts to harm beneficial insects.

**LCCMR goals:** We will work with small scale restorations in cities, counties, and the MN landscape arboretum to develop guidelines to protect beneficial insects and pollinators thru conservation biocontrol and IPM. We will determine conservation biocontrol management practices and determine pesticide residue in restorations that can influence beneficial insect survival and behavior. We will work with the MN listserv team, local community groups, MN Arboretum, and MN Extension Service (educators, Master Gardeners and Master Naturalists program) to disseminate these results.

</tr>
</tbody>
</table>
**Activity 2: Beneficial insect friendly pesticides.** We will develop research and outreach educational programs on conservation biocontrol of beneficial insects by understanding what chemical management used in landscapes/restorations/greenhouse conserve beneficial insects. We will identify to consumers and professional land managers the appropriate pesticide and application methods to use to reduce drift, reduce exposure to bees foraging, and reduce nontarget effects on other species. For instance use of insecticides to control Japanese beetle adults on roses or Japanese beetle grubs in turf may negatively affect leaf cutter bees and other bees. In addition, we will research what plants can be exempt from MN bee labeling laws, since these plants do not provide sufficient pollen and nectar for beneficial insects.

Plant establishment in landscapes/restorations and the production of bee-friendly plants usually require the use of an insecticide during propagation and after installation. The EPA has registered insecticides that are compatible with biocontrol, but are not widely used due to lack of data and relevant information accessible to the grower. We need to determine if biorational insecticides, such as, chlorantraniliprole (very high LD50), s-kinoprene (prevents the growth of immature insects) and pymetrozine (stops the mouthparts of aphids from working) produce no residue and conserve beneficial insects compared to conventional insecticides. We need to determine if current management practices produce residues in leaves that may harm native bees when they collect leaves for their nest cavities.

**LCCMR goals:** The project’s goals are to research ways to conserve beneficial insects (bees, butterflies, predators, and parasitoids) in landscapes and restoration projects thru the proper use of conventional and biorational insecticides. Plants not visited by bees will be identified, so they are exempt from special propagation practices. We will work with the MN listserv team, local community groups, MN Arboretum, and MN Extension Service (educators, Master Gardeners and Master Naturalists program) to disseminate these results.

VII. PROJECT STRATEGY:

A. Project Partners:

Partners receiving ENRTF funding: none

Partners NOT receiving ENRTF funding, but on listserve and part of online advisory committee
Listserve team: A listserve and website will be generated in the first months of the grant to connect with interested parties on the outreach and applied research. Initial surveys will be conducted to develop IPM guidelines and BMP for restorations. Invited parties are listed below and also will include, any others that want to be added to the listserve.

Partners NOT receiving ENRTF funding
Listserve team: A listserve and website will be generated in the first months of the grant to connect with interested parties on the outreach and applied research.
1. Minnesota Honey Producers (Dan Whitney, Pres, statewide);
2. + 3. MN Beekeepers (Steve Ellis, St Cloud and Jeff Anderson, Eagle Bend, MN);
4. Colorado State Beekeepers (President Beth Conrey, Denver, CO);
5. Minnesota Pollution Control Agency (Sarah Rudolf, St. Paul, MN);
6. Minneapolis Park and Recreation Board (Ralph Siefert, Minneapolis, MN);
7. MDA (Raj Mann, Geir Friisoe, St Paul, MN);
8. MNLA (Cassie Larson, Roseville, MN);
9. UM Landscape Arboretum (Sandy Tanck);
10. UM Master Gardeners (Tim Kenny, Chaska, MN);
11. UM Master Naturalists (Brit Forsberg, Amy Rager, Morris, MN);
12. MN DNR (Sarah Pennington, Brainerd, MN);
13. Wild Ones Native Plant (Stillwater Chapter);
14. UM Landcare (Les Potts);
15. Xerces Society (Eric Mader adjunct extension educator, UMN);
16. Pesticide Action Network NA, PANNA (Lex Horan, Minneapolis, MN);
17. MN Zoo (Erik Runquist, Apple Valley, MN);
18. Pollinator Friendly Org (Laurie Schneider, Stillwater, MN);
19. UM Raptor Center (Julia Ponder, St. Paul, MN);
20. Erin Rupp (Pollinate Minnesota, Lobbyist St Paul);
21. UM Hort (Mary Meyer, Chaska, MN); and any other interested groups or people.
22. Don MacSwain, Natural Resources Coordinator of Washington County Parks, St Croix Bluffs Park;
23. Jennifer Vieth, Executive Director of Carpenter Nature Center.
24. MN DOT.

Through conversations with different MN NGO's on the "MN pollinator google group" the listserv will expand its membership (Erin Rupp (Pollinate Minnesota, St Paul), Laurie Schneider (Pollinator Friendly Alliance, Stillwater), Margot Monson (Pollinator Friendly Alliance, St Anthony Park), Julia Kay (Wildones, Stillwater, MN), Julia Vanatta (Pollinator Revival, Minneapolis, MN), Patricia Hauser (Humming for bees, Minnetonka, MN), and Julia Kay). I already have worked with Laurie Schneider, Stillwater, "Pollinator Friendly Alliance" on picking out study sites; Sarah Foltz Jordon of the Xerces Society, Don MacSwain Natural Resources Coordinator of Washington County Parks, St Croix Bluffs Park; and Jennifer Vieth, Executive Director of Carpenter Nature Center. In Brainer, Sarah Pennington of the MN DNR has contacted me to work on some restorations in her area. I have spoken to Brit Frosberg of the UM Extension MN Naturalist Program and Sandy Tanck of the MN Arboretum on working with us on the research and outreach program. The outreach program will be posted on the three UM websites for which I am the webmaster, the  UMinnesota Extension website http://www.extension.umn.edu/garden/plant-nursery-health/;  the CFANS college website http://cues.cfans.umn.edu ; and the NCIPM webinars website+pollinator+plant videos website http://ncipmhort.cfans.umn.edu/ . I will create a blog that will be updated each week with links to relevant information about beneficial insect conservation in restorations. The first year I will set up the website and the email listserv on the research. Every year in May I will organize a workshop at the MN Landscape Arboretum, just as I did the 3 workshops in 2014-2015 "Pollinator Cubed" http://www.arboretum.umn.edu/P3Pesticides2.aspx  Each year I will produce at least one bulletin directed at different end users such as greenhouse/nursery growers, small restorations in county parks, and consumers on proper pesticide use and different restoration techniques. Our lab each year will provide 6 talks each year to small groups and at least 6 talks to UM associated groups

B. Project Impact and Long-term Strategy:
The project’s goals are to educate landscape managers (parks; state, county, city; municipal buildings, restoration managers, etc), and consumers on ways to conserve beneficial insects (bees, butterflies, predators, and parasitoids) thru conservation biocontrol, IPM , and proper insecticide use by providing workshops, websites, webinars, and bulletins based on the applied research.

VIII. REPORTING REQUIREMENTS:

• The project is for 3 years, will begin on 07/01/17, and end on 06/31/20.
• Periodic project status update reports will be submitted Aug 15 and Feb 15 of each year.
• A final report and associated products will be submitted between June 30 and August 15, 2020.

**Personnel (Wages and Benefits): Overall:**  

- Students: Grad student, $21/hr, 16.9% health insurance, $16,240 tuition; $7,500 summer salary = $42,500/yr x 3yrs = $128,000; 1.5 FTE  
- Students: UG summer technicians $10.00/hr x 40 hrs x 20wks = $8,000 x 2yrs = $16,000, 0.2 FTE  
- Non-students: Lab scientist: 26pp x 80hrs x $19.00/hr x 1.26 fringe = $49,800/yr x 3yrs = $150,000, 3.2 FTE  

**Professional Technical Contracts:**  

- Residue analysis of imidacloprid performed at USDA AMS Lab in Gastonia, NC, EPA approved lab, shipping samples overnight express on dry ice (180 x $352 = $63,600; + $225 x 24 = $5,400; total = $70,000); UM Soil testing lab 180 samples x $25 = $4,500  

**Equipment/Tools/Supplies:**  

- Research supplies: Bumblebee colonies 30@$120 each = $4,000; bee food, $1,000; *Osmia* bees, lacewings, lady beetles, monarch butterflies, parasitoids for experiments and insecticide tests, $12,000; greenhouse space for research $140/mo x 36mos = $6,000; flowering plants, (plugs, pots, soil, fertilizers) $1,000; insecticides, $1,000; UM field charges, $1,000  

**Printing:**  

- Outreach bulletins for distribution at meetings, University contract printing at Kinko $0.11BW/pg x 6 pg = $0.66 x 500 = $330 x 4 bulletins = $1,320 + other handouts = $2,000; peer-review article publication costs journal $2,000  

**Travel:**  

- Instate travel (mileage) to research sites. Three tentative field sites for restoration research, Brainerd, Chaska, Stillwater, rental car, one year: 2 wks/mo x 5 mos = 10 x $260/wk = $2,600 x $0.71/MI/UM fee = $442 + $2600 = $3,042/yr x 2yrs = $6,100/field; Instate travel to outreach activities: 2 Workshops at arboretum and 10 talks = 20 days x $45/day = $900  

**TOTAL BUDGET** $210,000  

---  

Supd. 08b
2017 LCCMR Project Title: Promoting conservation biocontrol of beneficial insects
Project PI: Vera Krischik, Department of Entomology, University of Minnesota

Activity 1A: Conservation biocontrol in restorations. Research and outreach educational programs will be performed to conserve beneficial insects by researching different cultural tactics in restorations.
